MONOXYGENASES. IN LIVER MICROSOMES, THIS ENZYME IS INVOLVED IN MADPH-DEPENDENT ELECTRON TRANSPORT PATHWAY. IT OXIDIZES A VARIET OF STRUCTURALLY UNRELATED COMPOUNDS, INCLUDING STEROIDS, FAITY ACIDS, AND XENOBIOTICS.

CATALYTIC ACTIVITY: RH + REDUCED FLAVOPROTEIN + O(2) = ROH + OXIDIZED FLAVOPROTEIN + H(2)O.

SUBCELLULAR LOCATION: MEMBRANE-BOUND. ENDOPLASMIC RETICULUM.
TISSUE SPECIFICITY: LIVER.

SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

THE SEQUENCE SHOWN HERE IS THAT OF THE LARGER ISOFORM
B.
B.
TISSUE SPECIFICITY: BASAL MEMBRANE OF THE UPPER ALIMENTARY TRACT
AND URINARY AND NASAL EPITHBLIA, SALIVARY GLANDS AND TEETH (BOTH
VARLANTS). ISOFORM A IS PREDOMINANTLY EXPRESSED IN SKIN, HAIR
FOLLICLES AND DEVELOPING NEURONS OF THE TRIGEMINAL GANGLION.
ISOFORM B WAS FOUND IN BRONCHI, ALVEOLI, STOMACH, INTESTINAL
CRYPTS, WHISKER PADS, CNS, TELENCEPHALIC NEUROECTODERM, THALANUS,
RATEKE'S POUCH, AND PERIVENVIRICULAR SUBSPENDYMAL GERMINAL LAYER.
-1- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT
WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.
-1- SIMILARITY: CONTAINS 6.5 LAMININ BEGF-LIKE DOMAINS.
-1- SIMILARITY: CONTAINS 1 LAMININ DOMAIN IV (DOMAIN IV' IS NOT
SIMILAR TO LAMININ DOMAIN IV (DOMAINS).
-1- SIMILAR TO LAMININ DOMAIN IV (DOMAINS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Developmental expression of nicein adhesion protein (laminin-5) subunits suggests multiple morphogenic roles."; Cell Adhes. Commun. 2:115-129(1994).

GABAA receptor delta subunit - mouse
C; Species: Mus sp. (mouse)
C; Date: 26-Jul-1996 #sequence_revision 26-Jul-1996 #text_cha
C; Caccession: 152630
R; Wang, J.B.; Kofuji, P.; Burt, D.R.
Brain Res. Bull. 29, 119-133, 1992
A; Title: Strain comparisons and developmental profile of the A; Reference number: 152630; MUID:92370453
A; Accession: 152630
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-449 <RES>

RESULT S63127

probable membrane protein YNL172w - yeast (Saccharomyces N;Alternate names: hypothetical protein N1677

cerevisiae)

```
C;Species: Saccharomyces cerevisiae
C;Date: 27-Apr-1996 #sequence_revis
C;Accession: S63127
                                                                                                                                                                                                                                                                                                              C;Species: Mus musculus (house mouse)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A novel interleukin-17 receptor (IL-17R) was identified by screening a cDNA library from T cell thymoma ELA cells, which were identified as binding fusion proteins comprising human immunoglobulin Gl (IgG1) Fc region and soluble IL-17 (CTLA-8) protein or a homologous Herpesvirus saimiri (HSV) protein, designated HSV13. Suppressing rejection of a grafted syngeneic or allogeneic organ or tissue to be transplanted with DNA encoding soluble IL-17R, so that expression of IL-17R by the engrafted organ or tissue results in suppression of rejection. Soluble IL-17R fragments comprise residues 1-320 of the murine IL-17R, residues 1-320 of the human IL-17R, and fragments of the extracellular domain that bind IL-17. The method is useful for regulating an immunoresponse, for suppressing rejection of grafted organs or tissues in the recipient and for treating or preventing diseases like allergy, as the and autoimmuno diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Suppressing rejection of a grafted syngeneic or allogeneic organ tissue in a graft recipient for organ transplantation involves transfecting the organ or tissue with DNA encoding soluble interleukin-17R receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                  asthma and autoimmune diseases. Note: This sequence does not appear in the specification. from the full length murine IL-17R (see AAY97180) and the (see AAY97183)

                                                                                                                                                                                                                                                                                                                                                                                                                             immune or inflammatory response in a mammal comprises administering soluble IL-17R. Soluble II-17R fragments comprise residues I-320 of the murine IL-17R, residues I-320 of the human IL-17R, and fragments of the extracellular domain that bind IL-17. The method is useful for regulating an immunoresponse, for treating or preventing diseases like allergy, asthma and autolimmune diseases, and for suppressing rejection of grafted organs or tissues in the recipient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A novel interleukin-17 receptor (IL-17R) was identified by screening cDNA library from T cell thymnoma EL4 cells, which were identified as binding fusion proteins comprising human immunoglobulin G1 (IgG1) Fc region and soluble IL-17 (CTLA-8) protein or a homologous Herpesvirus saimiri (HSV) protein, designated HSV13. Regulating an

                  The murine interleukin-17 receptor (IL-17R) (AAW04184) is a type I transmembrane protein that binds IL-17 (CTLA-8, see also AAW02386) and HVS13 (AAW02387), a viral homologue of IL-17. Its amino acid sequence was deduced from a cDNA clone (AAY33800) isolated from murine thymoma EL4 cells. Soluble, recombinant forms of the receptor (partic. amino acids 1-322) can be prepd. in transformed host cells and used to regulate immune and inflammatory responses, in methods for suppressing rejection of grafted organs or tissue, and in assays of IL-17 and IL-17R.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This polypeptide comprises mouse full-length interleukin-17 creeptor (IL-17R). A claimed method for reducing the amount of nitric oxide produced by a cartilage associated cell comprises contacting the cell with a soluble IL-17R, especially claimed soluble murine or human (see AAW61272) IL-17R comprising the signal peptide and extracellular domains of the respective full-length receptors. Recombinant soluble IL-17R polypeptides can be obtained using prokaryotic or eukaryotic (for glycosylated products) expression systems. A cDNA sequence (see AAW27591) coding for full-length murine IL-17R is provided. IL-17 is known to stimulate nitric oxide production from cartilage-associated cells in individuals with osteoarthritis. Inhibitors of nitric oxide production, such as soluble IL-17R, may therefore be useful to ameliorate the effects of nitric oxide in osteoarthritis as in other disease conditions in which nitric oxide plays a role, e.g. autoimmune and inflammatory diseases.

                                                                                                                                                                                                                                                                                                                                                      This sequence represents a murine interleukin-17 receptor (IL-17R). IL-17R polypeptides have immunoregulatory activity. They can be used inhibiting T cell proliferation, or for inhibiting T cell activation. particular they can be used for preventing or treating organ or graft rejection, autoimmune disease, allergy or asthma. They can also be use for the prevention or treatment of inflammatory disease in which activated T cells play a role or for inhibiting B cell proliferation or immunoglobulin secretion. The IL-17 polypeptides can also be used as immunogens, reagents in in vitro assays, or as binding agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Кеу

                                                                                 The present invention relates to a novel receptor that binds Interleukin 17 (IL-17, also known as CTLA-8) and a Herpesvirus saimiri homolog, HVS13. The receptor is a type I transmembrane protein which is referred to as IL-17R. Murine thymona EL4 cells were found to express a receptor for IL-17. An EL4 mammalian expression library was screened and a cDNA encoding the receptor was identified. The present sequence is the murine IL-7R protein. The cDNA was used to isolate DNA encoding human IL-17R by cross species hybridisation. The human IL-17R cDNA and protein are described in AAA61240 and AAY99941. Soluble forms of the receptor may be used to regulate immune responses, for example to suppress rejection of organ grafts. Antibodies to IL-17R consisting of amino acids 1-322 of murine IL-17R or 1-320 of human IL-17R may be useful as components of diagnostic or research assays. Such antibodies may also be used in affinity purification of the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IL-17R;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              binding fusion proteins comprising human immunoglobulin G1 (IgG1) FC region and soluble IL-17 (CTLA-8) protein or a homologous Herpesvirus saimiri (HSV) protein, designated HSV13. Regulating an immune or inflammatory response in a mammal comprises administering soluble IL-17R. Soluble IL-17R fragments comprise residues 1-322 of the murine IL-17R, residues 1-320 of the human IL-17R, and fragments of the extracellular domain that bind IL-17. The method is useful for regulating an immunoresponse, for treating or preventing diseases like allergy, asthma and autoimmune diseases, and for suppressing rejection of grafted organs or tissues in the recipient.

Suppressing rejection of a grafted syngeneic or allogeneic organ or tissue in a grafted with DNA encoding soluble IL-17R, so that expression of IL-17R by the engrafted organ or tissue results in suppression of rejection. Soluble IL-17R fragments comprise residues 1-320 of the human IL-17R, and fragments of the extracellular domain that bind IL-17. The method is useful for regulating an immunoresponse, for suppressing rejection of grafted organs or tissues in the recipient and for treating or preventing diseases like allergy, asthma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-MAR-1996;

                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to an isolated and purified interleukin-17 receptor (IL-17R). A soluble IL-17 protein (OTLA8) and a herpesvirus siamiri (HVSI3) open reading frame (homologous to CTLA8) were expressed as fusion proteins comprising an immunoglobulin Fc region, and used to screen for the expression of the IL-17R. The screening identified the novel receptor of the invention. IL-17R is a type I transmembrane protein that exhibits antiinflammatory, immunosuppressive, antiasthmatic and antiallergic activities, and is an inhibitor of T cell proliferation and activation. IL-17R can be used to regulate immune functions, and is useful for preventing or treating organ or graft rejection, autoimmune disease, allergy or asthma. The present sequence represents the murine interleukin-17 receptor amino acid sequence identified in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
```

The invention is directed towards assays for detection of interleukin-17 (IL-17), IL-17 receptor (IL-17R), and (antagonists or mimetics of) the interaction between IL-17 and IL-17R. The assay kit comprises an IL-17R protein and a detecting reagent. The method is useful for inhibiting binding of IL-17 to cells expressing IL-17R. IL-17 receptors are also

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Interleukin-17 and their corresponding nucleic acid molecules. IL-17R is a Type I transmembrane protein which is used for regulating the immune response. The invention is useful for suppressing rejection of a grafted organ or tissue in a graft recipient. Soluble IL-17 (CTLA-8) receptors are useful for preventing or treating organ or graft rejection, autoimmune disease, allergy, asthma, and inflammatory disease in which activated T-cells play a role. Soluble IL-17 fusion proteins are used to screen cells for the expression of IL-17 receptor. Derivatives of IL-17R are also used as immunogens, reagents in in vitro assays, or as binding agents for affinity purification procedures.

Its amino acid sequence was deduced from a cDNA clone (AAM3801) isolated from a human peripheral blood lymphocyte library. Soluble, recombinant forms of the receptor (partic. amino acids 1-320) can be prepd. in transformed host cells and used to regulate immune and inflammatory responses, in methods for suppressing rejection of grafted organs or tissue, and in assays of IL-17 and IL-17R.

                                  This polypeptide comprises human full-length interleukin-17 receptor (IL-17R). A claimed method for reducing the amount of nitric oxide produced by a cartilage associated cell comprises contacting the cell with a soluble IL-17R, especially claimed soluble interpretation of the respectation of the signal peptide and extracellular domains of the respective full-length receptors. Recombinant soluble IL-17R polypeptides can be obtained using prokaryotic or eukaryotic (for glycosylated products) expression systems. A cDNA sequence coding for full-length human IL-17R is provided (see AAV27592). IL-17 is known to stimulate nitric oxide production from cartilage-associated cells in individuals with osteoarthritis. Inhibitors of nitric oxide production, such as soluble IL-17R, may therefore be useful to ameliorate the effects of nitric oxide in osteoarthritis as well as in other disease conditions in which nitric oxide plays a role,
                                                                                                                                                                                                                                                                                                                Reducing nitric oxide production by cartilage associated cells -contacting cells with soluble interleukin-17 receptor, useful to treat osteoarthritis and autoimmune and inflammatory diseases

IL-17R polypeptides have immunoregulatory activity. They can be used for inhibiting T cell proliferation, or for inhibiting T cell activation. In particular they can be used for preventing or treating organ or graft rejection, autoimmune disease, allergy or asthma. They can also be used for the prevention or treatment of inflammatory disease in which activated T cells play a role or for inhibiting B cell proliferation or immunoglobulin secretion. The IL-17 polypeptides can also be used as immunogens, reagents in in vitro assays, or as binding agents for

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a novel receptor that binds Interleukin 17 (II-17, also known as CTLA-8) and a Herpesvirus saimiri homolog, HVS13. The receptor is a type I transmembrane protein which is referred to as IL-17R. Murine thymona EL4 cells were found to express a receptor for IL-17. An EL4 mammalian expression library was screened and a cDNA encoding the receptor was identified. The murine IL-17R cDNA and protein are described in AAA61238 and AAY99935. The CDNA was used to isolate DNA encoding human IL-17R by cross species hybridisation. The present sequence is the human IL-7R protein. Soluble forms of the receptor may be used to regulate immune responses, for example to suppress rejection of organ grafts. Antibodies to IL-17R consisting of amino acids 1-322 of murine IL-17R or 1-320 of human IL-17R may be useful as components of diagnostic or research assays. Such antibodies may also be used in affinity purification of the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US6072037-A
